

ABSTRACT OF THE DISCLOSURE

A fish cleaning device includes a base having an upper surface and a lower surface, one or more arms, each having a first and second end. The first end of the arm is pivotally attached to the base. A clamp-securing member is pivotally attached to the second arm end and a clamp is attached to the clamp-securing member. The device allows for the cleaning of both sides of a fish with decreased handling of the fish. The device is used by securing the fish to the clamp, cleaning one side of the fish, pivoting the arms relative to the base, thereby flipping the fish, and cleaning the second side of the fish.
